Unlike traditional casino video games where gamers position bets and wait on cards to be dealt or reels to stop, Limbo operates on a single variable set by the user: **the target multiplier**.

The player sets a desired payout multiplier (e.g., 2x, 10x, or even 1,000 x), puts a wager, and strikes the "Bet" button. The game's algorithm then creates a random multiplier. If the created multiplier is equivalent to or greater than the gamer's target multiplier, the bet wins. If it fails, the bet is lost.

Secret Characteristics of Limbo:

- **Minimalist Interface:** Usually including just a couple of input boxes and a huge multiplier readout.
- **High Multiplier Potential:** Players can often target multipliers varying from a modest 1.01 x to an astronomical 1,000,000 x.
- **Provably Fair:** Most variations of Limbo utilize cryptographic hashing, enabling gamers to independently validate the fairness of each and every single round.

4. **Initiate the Round:** Clicking "Bet" activates the random number generator (RNG).

5. **The Result:** The system reveals the produced multiplier. If it fulfills or surpasses the target, the player wins their stake increased by their target.

(Note: Exact probabilities usually consider a small House Edge, generally around 1% to 2%, meaning the real chances are somewhat lower than 100 divided by the multiplier).
