Also known as roof shingles or zoster, herpes zoster is brought on by the exact same virus as chicken pox. After the poultry pox clear, the virus remains inactive (inactive) within specific nerve cells of the ...

CAUSES OF SKIN TAGS

Causes of Skin Tags

Researchers have not been able to pinpoint the exact reason why people develop skin tags. However, there are a number of theories or assumptions based on cases that researchers study and cross-reference. One theory is that irritation or friction may play a role. For example, skin tags usually develop on body folds where the skin folds and rubs together, like the underarms, groin, neck or eyelids.

However, some researchers think insulin resistance may play a major role because the growths are very common in patients with diabetes. It may also be related to viral infections. Another scientific study examined 49 patients with acrochordons. They noted that a large percentage of the subjects had the human papillomavirus (HPV). This detail suggests that there may be a correlation with this particular virus.

Doctors theorize acrochordons may be genetic. In a genetic disorder called Birt-Hogg-Dube Syndrome, patients often have numerous skin tags along with other skin conditions. However, skin tags may simply be a characteristic of normal aging as the skin loses elasticity.
