

Quick answer: Höveler Original Sport carries a declared mineral package — calcium 1.2%, phosphorus 0.6%, magnesium 0.7%, sodium 0.6% — plus high vitamin E, in a reduced-starch sports muesli. Best for owners who want the micronutrient math done inside the feed instead of a balancer on the shelf. Price: \$49.99. Last checked: September 2026.

Micronutrients are where feeding gets honest. Energy and protein show up in the horse's topline; vitamins and minerals only show up years later, in feet, bones, and staying-soundness. Most owners would rather not do the mineral math themselves. Höveler did it, and declared the numbers. Here are the seven worth knowing.

1. Calcium 1.2% and phosphorus 0.6% — the classic 2:1 balance

Original Sport declares calcium at 1.2% and phosphorus at 0.6%. That is the roughly 2:1 calcium-to-phosphorus ratio equine nutritionists look for in a total ration — phosphorus excess is the thing a good formula guards against, especially alongside hay and grain-based ingredients. The ratio here is textbook. The benefit: skeletal-mineral balance handled inside the feed, not by your spreadsheet.

2. Magnesium 0.7% — the working-horse mineral

Magnesium is declared at 0.7%. Horses in regular work draw on magnesium for normal muscle and nerve function, which is why performance formulas pay attention to it. In Original Sport it arrives via the magnesium oxide in the ingredient list, alongside the feed's other mineral sources. Who this is for: owners of horses in consistent training who want the muscle-and-electrolyte mineral covered daily.

3. Sodium 0.6% — salt built into the ration

Sodium is listed at 0.6%, with sodium chloride among the declared ingredients. Working horses lose sodium in sweat, and a ration that accounts for it takes a job off your checklist. Free-choice salt should still be available, of course — but the baseline is built into the formula, not left to chance. The benefit: a published sodium figure for a horse that really works up a sweat.

4. High vitamin E — the antioxidant anchor for hard work

Original Sport is high in vitamin E, one of its headline standouts. Vitamin E is the nutrient most associated ***Click here for more*** with supporting horses in regular work, paired in this formula with grape seed meal at 0.5% for extra plant-based antioxidant support. For a horse in a serious program, that combination is built for the workload. Who this is for: competition horses whose owners would otherwise have a separate vitamin E tub on the shelf.

5. The minerals sit on quality forage, not filler

Mineral numbers mean more on a base of alfalfa, green meal, wheat bran, and sunflower extraction meal than on processed filler. Original Sport's declared package — calcium 1.2%, phosphorus 0.6%, magnesium 0.7%, sodium 0.6% — rides on a 16.4% crude-fiber, forage-forward formula. Micronutrients alongside the macronutrients a horse was built to eat. The benefit: a mineral package delivered in a matrix the hindgut handles well.

6. Every figure is declared, so you can compare honestly

This is the quiet advantage: all the key numbers are on the label. Crude protein 15.1%, crude fat 9.0%, crude fiber 16.4%, starch 15%, sugar 4.6%, along with the mineral panel above. When a maker publishes its figures, you can put it next to any other bag on the shelf — and expect it to keep its promises. Who this is for: careful buyers who compare guaranteed analyses line by line.

7. One bag does the balancer's job too

With the vitamin and mineral package built in, many owners can leave the separate balancer pellet behind. One feed, formulated by a maker with over 120 years of expertise (since 1905), made in Germany, sold at \$49.99, and backed by a 30-Day Money-Back Guarantee and a 24/7 licensed vet team. Fewer buckets, less math, same coverage. The benefit: micronutrient completeness without adding ***performance horse feed*** a second product to the shelf.

How to feed it

Feeding rates for Original Sport, per 220 lb (100 kg) body weight per day:

Work level	Feed per 220 lb (100 kg) body weight daily
Light work	0.55 lb (250 g)
Medium work	0.88 lb (400 g)
Heavy work	1.32 lb (600 g)

Hay ration: 3.31 lb (1.5 kg) per 220 lb body weight daily, alongside the concentrate.

Key specs at a glance: calcium 1.2%, phosphorus 0.6%, magnesium 0.7%, sodium 0.6%, high vitamin E, crude ash 9.9%.

Calculate your horse's exact ration with the Feeding Calculator, and find the whole declared package on the Höveler Original Sport product page.

Frequently asked questions

Does this feed replace a mineral balancer?

The declared package — calcium 1.2%, phosphorus 0.6%, magnesium 0.7%, sodium 0.6%, high vitamin E — is designed to make Original Sport a complete performance ration at the recommended rate. Many owners use it without a separate balancer; the 24/7 licensed vet team can look at your specific setup.

Why does the calcium-to-phosphorus ratio matter?

Horses need more calcium than phosphorus in the total diet, and the 1.2% / 0.6% figures in this feed uphold that classic balance. A formula that misses the mark can work against bone mineralization over time.

Is the vitamin E natural or synthetic?

The published figures confirm Original Sport is high in vitamin E; they do not specify the form of the source. If the specific form matters to your program, the 24/7 licensed vet team can talk it through with you before you reach for a separate supplement.

Do working horses need extra electrolytes on top?

The feed carries sodium at 0.6% for a working-horse baseline. Horses in heavy sweat may still need additional electrolytes during hard work in heat — talk to your veterinarian.

Will the minerals suit a growing young horse?

Original Sport is formulated for working horses, not as a growth feed. Young horses in training have their own mineral requirements — check with the vet team before using it as a sole ration for one.

Is it competition-legal?

Yes — competition-safe and FEI-compliant. Confirm your event's specific rules with the organizer.
